

ABSTRACT OF THE DISCLOSURE

A method, system, article of manufacture, and propagated signal which provides an easy and flexible way for consumers to print digital photographs received and processed from a variety of different sources and a variety of different ways. Image information, which represents a photographic image, is received from several different sources, order information is received from an external network, the order is processed based on the digital image and the order information, and the photographic images are then output or uploaded in order to produce a photographic print or merchandise with an image printed thereon. The ordering of products is also improved by maintaining the images to be uploaded in a local memory until the order is complete.
